4 Physics with $\nu_\mu \rightarrow \nu_{\mu,\tau}$

5 Summary and conclusions

Requirements of the FNAL/Homestake Beam

The design specifications of a new WBLE beam based at the Fermilab M1 are driven by the physics of $\nu_\mu \rightarrow \nu_e$ oscillations:

Requirements:

- Maximal possible neutrino fluxes to encompass the 1st and 2nd oscillation nodes, with maxima **at 2.4 and 0.8 GeV.**
- High purity ν_μ beam with negligible ν_e

- Minimize the neutral-current feed-down contamination at lower energy, therefore minimizing the flux of neutrinos with energies **greater than 5 GeV** where there is no sensitivity to the oscillation parameters is highly desirable.

Maximizing sensitivity to CPV

Latest measurement from MINOS: $\Delta m_{32}^2 = 2.43 \pm 0.13 \times 10^{-3} \text{ eV}^2$

LAr detector - $\Delta m_{31}^2 = 2.7$

Summary and
conclusions

For water Cerenkov 2 possible beam design strategies to optimize CPV sensitivity

- **Strategy 1: Increase low energy flux and 2nd oscillation maximum through improved focusing. this talk.**
- **Strategy 2: Improve S:B at low energies by reducing high energy tail using beam plugs.**

Strategy 1: Optimize focusing to maximize ν_μ flux at 2nd oscillation maximum using NuMI-like horns

Insert CC target ($r=6\text{mm}, L=80\text{cm}, \rho = 2.1\text{ g/cm}^3$) into NuMI Horn1, increase current to 250kA:

Target and Horn 1 - Top View

Default NuMI target/fin/baffle

Target and Horn 1 - Top View

New denser target, all the way in

1- Decrease separation between Horn1 and Horn2 (fully embedded target)

DUSEL event rates with different horn/target configs

Moving the horns closer increases the low energy flux

Physics with $\nu_\mu \rightarrow \nu_{\mu,\tau}$

Precision measurements of ν_τ appearance

Using wide-band WBLE 120 GeV on-axis beam with a 4m diameter
400m length decay tunnel:

wble120 disappearance 1300km / 0km

ν_μ rates: 4000 unosc CC/10kT/MW.yr (10^{21} POT), **2000 osc CC/10kT/MW.yr**

Assuming lepton universality $\sigma^{CC}(\nu_\tau)/\sigma^{CC}(\nu_{\mu,e}) = 1.0$:

We expect 1280 ν_τ CC/10kT/MW.yr ≥ 3.2 GeV

- For a smaller LAr detector we can see 100's of ν_τ appear (compared to 3-4 events in DONUT and $\sim 10?$ in OPERA)
- For water Cerenkov ν_τ QE interactions followed by $\tau \rightarrow \mu, e$ will

— ν_μ - - - $\bar{\nu}_\mu$

Neutrino running

Anti neutrino running

- Separation of QE $\nu_\mu, \bar{\nu}_\mu$ interactions is possible in a non-magnetized detector - using μ lifetime and $\cos \theta_\mu$, angle of the outgoing muon w.r.t beam (MiniBoone Nucl. Phys. Proc. Suppl. 159, 79(2006)).

DUSEL LB experiments = the best measurement of Δm_{32}^2 and $\Delta \bar{m}_{32}^2$

$\nu_\mu, \bar{\nu}_\mu$ disappearance provide precision tests of CPT, sterile neutrino models, Lorentz violation...etc.

Summary and conclusions

Physics sensitivity with WCe, 3σ for all δ_{cp} (θ_{13} , hier)/50% δ_{cp} (CPV)

	300kT	2MW 3+3yrs	10%	0.006	0.013	0.015

NB: Flux at 1st oscillation maximum has increased by 25% since these calculations

- To improve CPV violation at lower Δm_{31}^2 we need to increase flux at lower energies.
- Using an embedded target in the NuMI horns running with 250kA, we can achieve 80% focusing efficiency at the 1st oscillation maxima and 40% focusing efficiency at the 2nd oscillation maxima. We can still gain with a 120 GeV on-axis beam by improving low energy focusing efficiency.
- If we can measure the intrinsic ν_e background to 1 – 2%, then using a large detector with excellent S:B, we can observe ν_e appearance even if $\theta_{13} = 0$.
- High precision measurements of $\nu_\mu, \bar{\nu}_\mu$ disappearance test universality, CPT, Lorentz violation, sterile neutrino models, light gauge boson models.
- Large appearance signal of ν_τ above the τ production threshold.

- **Improving CPV sensitivity:**
 - **Explore some more horn design options to improve focusing efficiency at low energies - make horn bigger?.**
 - **Pursue Strategy 2 - improving S:B at the 2nd oscillation maxima - studies using beam plugs to cut high energy tails.**
 - **Adjustable off-axis targeting systems?**
- **Explore improving ν_τ physics sensitivity using an adjustable focusing system.**
- **Explore requirements for determining the θ_{23} quadrant.**
